## Scene Double launches VUE/3500 ExtremeLink™, long-distance Cat 5, DVI, audio and USB extender

### VUE/3500 extreme long distance DVI, audio and USB extender solution over CatX cables.

The VUE/3500 KVM and video extender powered by ExtremeLink™ delivers a new generation of long-haul DVI video, audio and USB extension capability, allowing keyboard, video, audio and mice, as well as other USB 1.1 and 2.0 devices to be located up to 500m away from a computer connected by a single Cat5 cable or wide area network.

It supports HD video up to 1680 x1050 resolution at 24 bit colour depth with video latency less than 60 milliseconds, stereo audio and USB2.0 up to 80Mb/s. Using the latest Extreme technology the VUE/3500 delivers superior picture quality and video performance with complete support of up to 13 USB devices and no degradation of resolution over distance.

Designed for high quality applications where the user terminal needs to be physically separated from the computer for aesthetic, environmental or security reasons, the VUE/3500 provides totally transparent operation, giving operators instant and completely reliable access to their video and data. It is ideally suited to critical installations in security, education, medical, interactive digital signage and industrial environments.

“This product was designed specifically for OEM and professional users”, said Ray Gordon, Founder and Managing Director of Scene Double. “It delivers fibre optic quality at a Cat5 price. Digital transmission of signals means that the transmitter and receiver are isolated and not susceptible to noise on the transmission line that degrades the image quality of analogue devices. As a result we can achieve very high bandwidth data transfer over extreme distances with absolutely no loss in image or data quality. Full USB support enables easy connection and control of peripheral devices including disk drives, cameras and flash memory sticks. ”

The VUE/3500 forms part of Scene Double’s extensive range of “Plug and Play” KVM solutions that do not require additional drivers, software, or configuration and work with all operating systems including: Windows 7/Vista/XP, MAC OS, and Linux.

## About Scene Double

Scene Double's design and manufacturing experience and expertise in the professional KVM and video extension market stretches back over 19 years from its formation in 1991. Many products are manufactured under OEM relationships with some of the computer industry's largest suppliers of computer systems and peripherals from Scene Double's own UK-based state-of-the-art manufacturing facility capable of volume surface-mount and complete product assembly. Direct sales of KVM, DVI and video extension and switching devices is also undertaken from the headquarters site in Hertfordshire to major organisations throughout the world where they are renowned for their quality, innovation and reliability.

Scene Double has entered into a number of technology cross-licensing and marketing deals with other companies in similar markets. The company prides itself on a strong level of personal support, provided in most case by engineers responsible for original product design. This has culminated in the recent opening of a fully equipped and spacious training facility for all its own products, together with those of its partner companies. Scene Double also offers full system specification services to assist dealers and system integrators in specifying and using its KVM and DVI switching and extension product range.
